

1. Write a program that defines a class **Shape** with a two parametric constructor that gives value to **width** and **height**. Define two subclasses **Rectangle** and **Triangle** both of which calculate with method **area** the area of the shape. In the main you have to define two variables a triangle and a rectangle. After that you have to give in rectangle constructor values 5 and 3. Furthermore you have to give in triangle constructor values 2 and 5. In the end you have to call first the method **area** of rectangle and then you have to call the method **area** of triangle. Sample print is in figure 1.

```

2. Write a program with a class **Mother** and an inherited class **Daughter**. Both of them should have a method **void display()** that prints a message (different for mother and daughter). In the main define a daughter and call the **display()** method on it. Sample print is in figure 2.

```
L:\Metropolia\shell\public_html\2016-2017\TI00AA50-3010\t...
daughter: display function

3. Write a program with a mother class **Animal**. Inside it define a **name** and an **age** variables and function **set_value()**. Then create (sub classes) two bases variables **Zebra** and **Dolphin** which write a message telling the **age**, the **name** and giving some extra **information** (e.g. place of origin). Sample print is in figure 3.

```
L:\Metropolia\shell\public_html\2016-2017\TI00AA50-3010\tt\03\03\...
The zebra named p1@ is 5years old. The zebra comes from Africa.
The dolphin named ëLC-■ rs u@ is 2years old. The dolphin comes from New Zeland.

4. Suppose we would like to manipulate points in a 2D space (two dimensional space). It is natural for us to define a class for this purpose. Let's call this class **TwoD**. Suppose later on we decide to implement a class to deal with points in a 3D place (three dimensional space). In **TwoD** are attributes **X** and **Y**. Make the definition for the **ThreeD** class using inheritance. Define also two parametric constructor for class **TwoD** and three parametric constructor for class **ThreeD**. Define **set**- and **get**-methods for all properties (fields). Implement main function where you create one 2D point and after that you create one 3D point. Then you print the value of 3D point instance. Sample print is in figure 4.

```
L:\Metropolia\shell\public_html\2016-2017\TI00AA50-3010\t...
Coordinates for the 3d object are:
1, 2, 3
